

16TH JACQUES POLAK ANNUAL RESEARCH CONFERENCE  
NOVEMBER 5–6, 2015

---

# The Macroeconomic Effects of the Federal Reserve's Unconventional Monetary Policies

Eric M. Engen  
Federal Reserve Board

Thomas Laubach  
Federal Reserve Board

David Reifschneider  
Federal Reserve Board

Paper presented at the 16th Jacques Polak Annual Research Conference  
Hosted by the International Monetary Fund  
Washington, DC—November 5–6, 2015

**The views expressed in this paper are those of the author(s) only, and the presence of them, or of links to them, on the IMF website does not imply that the IMF, its Executive Board, or its management endorses or shares the views expressed in the paper.**

# The Macroeconomic Effects of the Federal Reserve's Unconventional Monetary Policies

Eric Engen, Thomas Laubach and David Reifschneider  
Federal Reserve Board

*Presented at the sixteenth*

Jacques Polak Annual Research Conference  
International Monetary Fund  
November 5, 2015

The opinions expressed are those of the authors and do not necessarily reflect the views of anyone else in the Federal Reserve System.

# Two Questions

1. Did the Fed's unconventional policy actions alter beliefs about its implicit policy rule?
  - Use Blue Chip forecasts to infer changes in perceived policy rule
  - Finding – marked shifts in rule after explicit FG and QE expansion
2. Did changes in the perceived policy rule plus QE-related term premium effects provide much stimulus?
  - Use FRB/US to simulate outcomes w/o unconventional policy
  - Finding – moderate support to real activity and inflation

# Review of Unconventional Policy Actions

1. Asset purchases and other QE programs
  - \$3.8 trillion in purchases (Treasuries and MBS, three phases)
  - Other actions – reinvestment, maturity extension program
  
2. Forward guidance
  - Qualitative (Dec 2008 through June 2011)
  - Calendar-based and explicit (Aug 2011 through Oct 2012)
  - Threshold conditions (Dec 2012 through Jan 2014)

# Blue Chip Forecasts of Average Annual Conditions

## Unemployment Rate

## Imputed Output Gap -- $2(U^*-U)$

## GDP Price Inflation

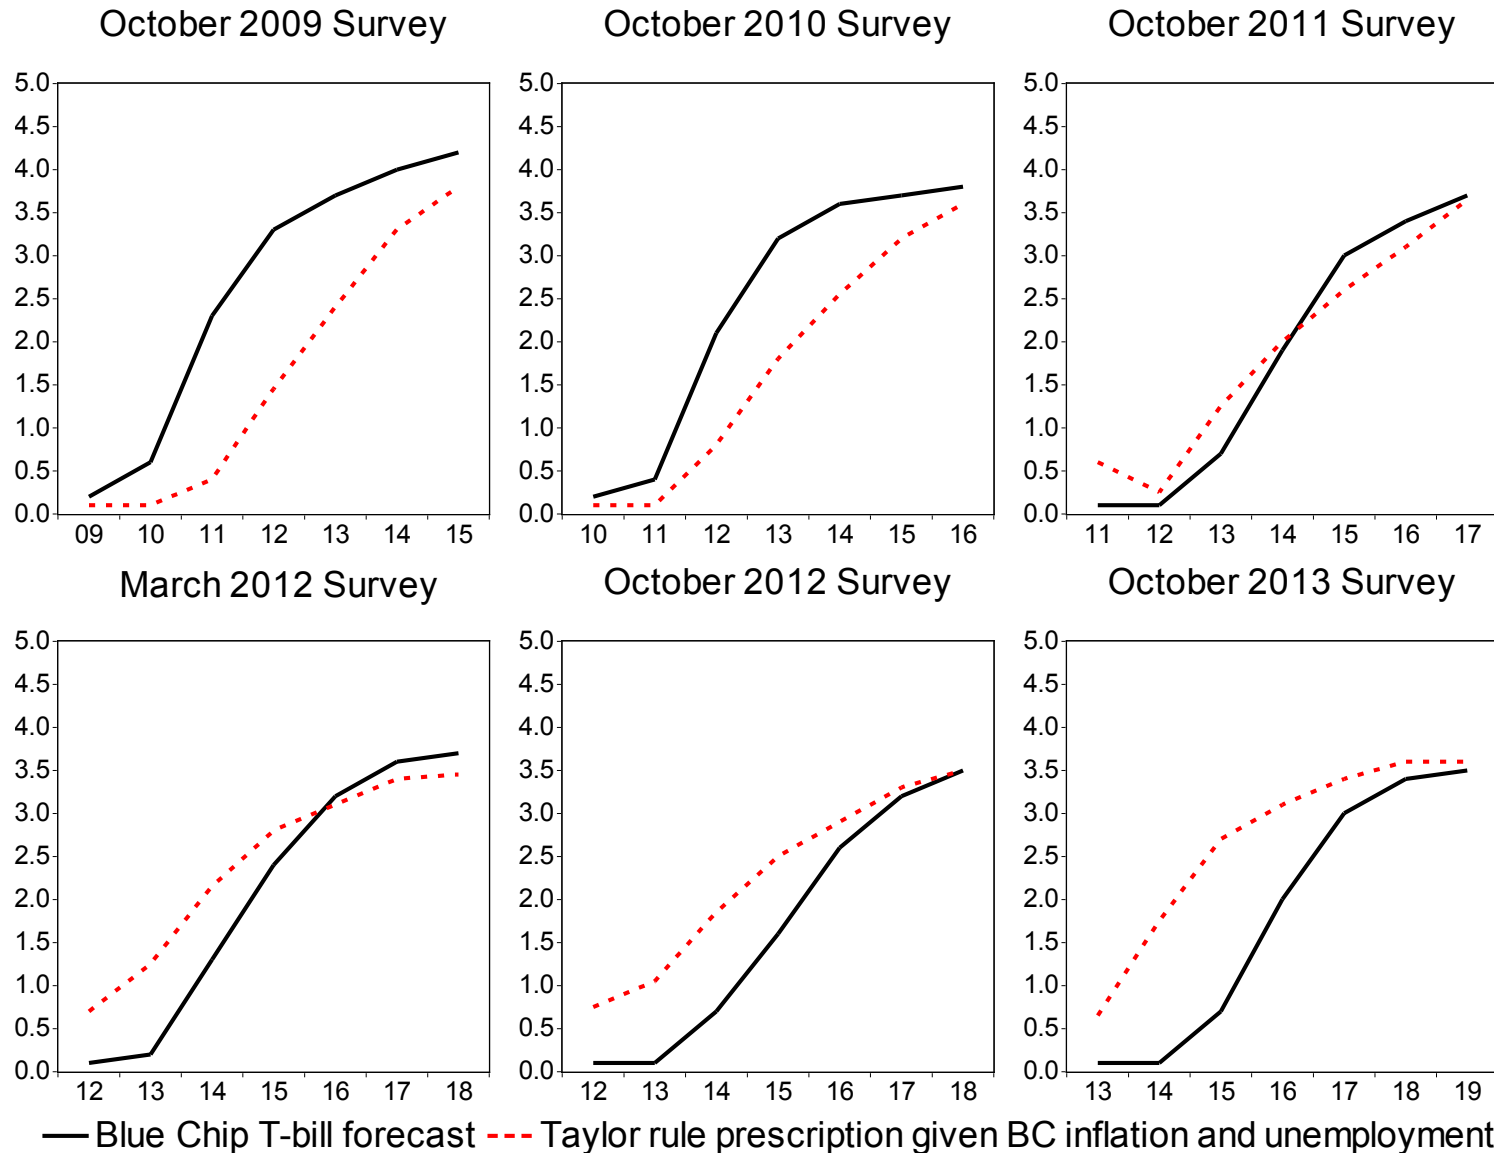

## 3-Month Treasury Bill Rate

— 2007 forecast    — 2008 forecast    — 2009 forecast    — 2010 forecast  
— 2011 forecast    — 2012 forecast    — 2013 forecast

# Blue Chip T-Bill Forecasts and Taylor Rule Prescriptions

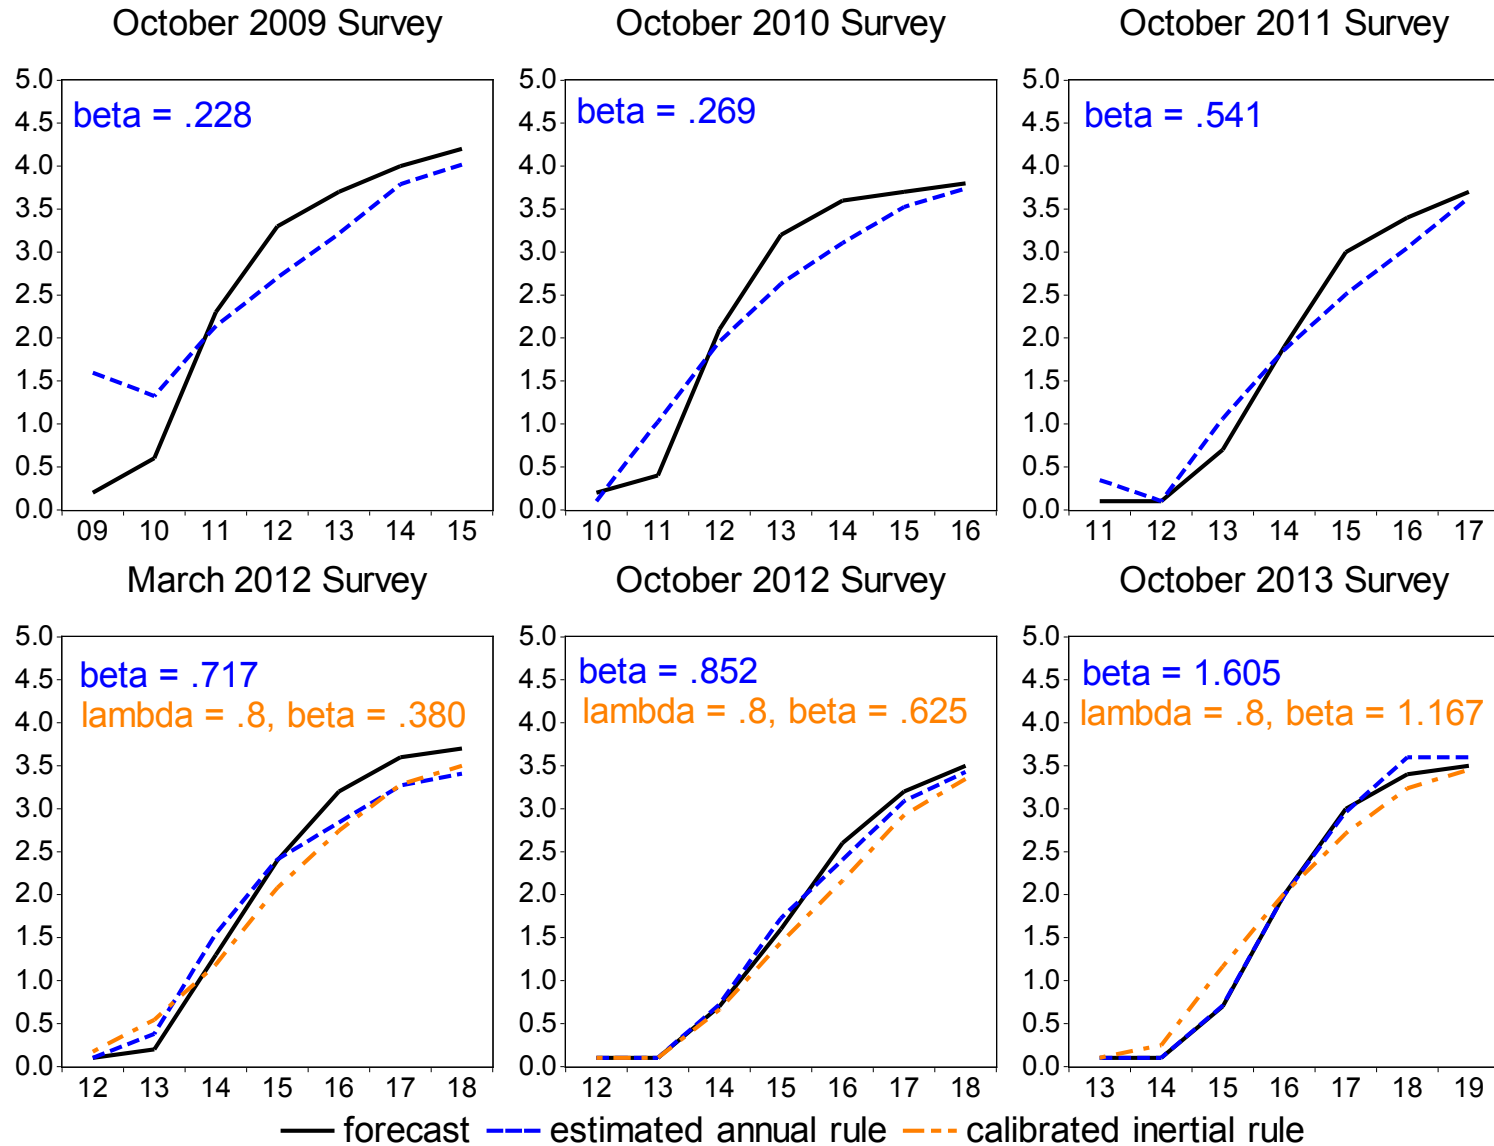

# Identifying Shifts in BC-Consistent Policy Rules

- Assume forecasters always expect the same general rule but may update its perceived parameters over time

$$i_t = r^* + \pi_t + \alpha(\pi_t - \pi^*) + \beta gap_t$$

- March/October surveys provide forecasts for  $i_t$ ,  $\pi_t$  and  $gap_t$  for years 0 to 6, plus  $r^*$  and  $\pi^*$ 
  - Estimate separate  $\beta$  for each survey
  - Assume  $\alpha = 0.5$  (projected inflation gaps uninformative)
- For pooled 1992-2007 surveys,  $\alpha$  and  $\beta$  close to 0.5

# Blue Chip T-Bill Forecasts and Fitted Policy Rules

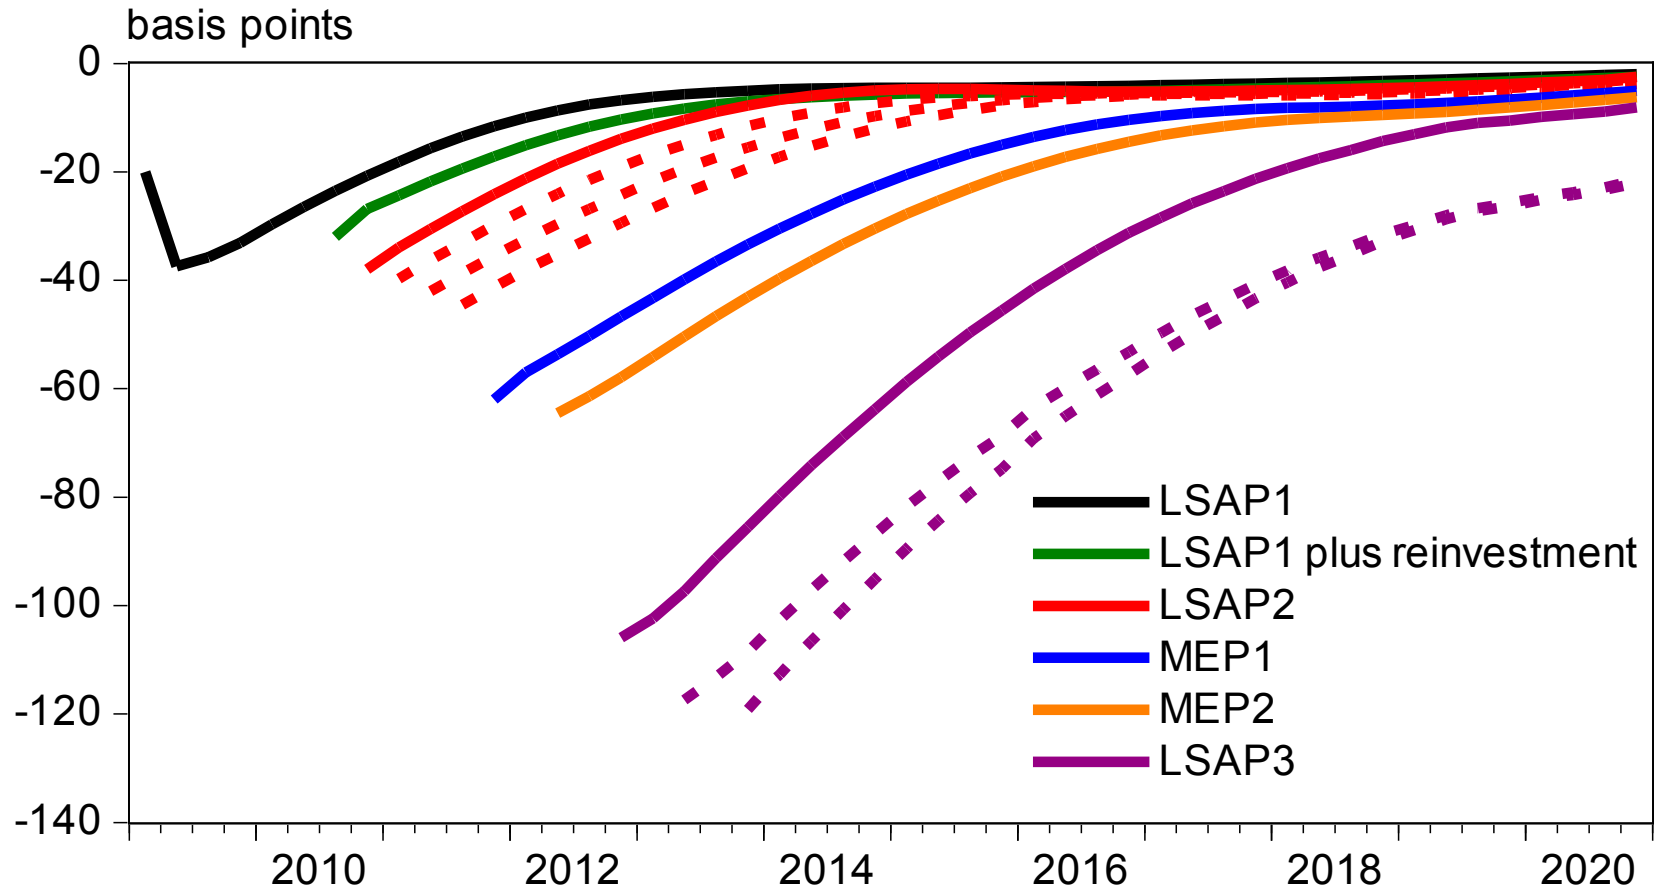

# What Were the Macro Effects of Unconventional Policy?

1. Difficult question
  - Did others also perceive a shift in the policy rule?
  - Not obvious how to embed changes in perceived rule in a VAR
  - Structural models may not account for term premium effects
2. Use FRB/US model
  - Structural model with rational expectations
    - but simulations incorporate gradual learning
  - Model incorporates role for term premiums
  - Has dynamics similar to range generated by other models
3. Address uncertainty using alternative versions of the model (e.g., lower interest elasticity of demand)

# Evolution of QE-Related Term Premium Effects

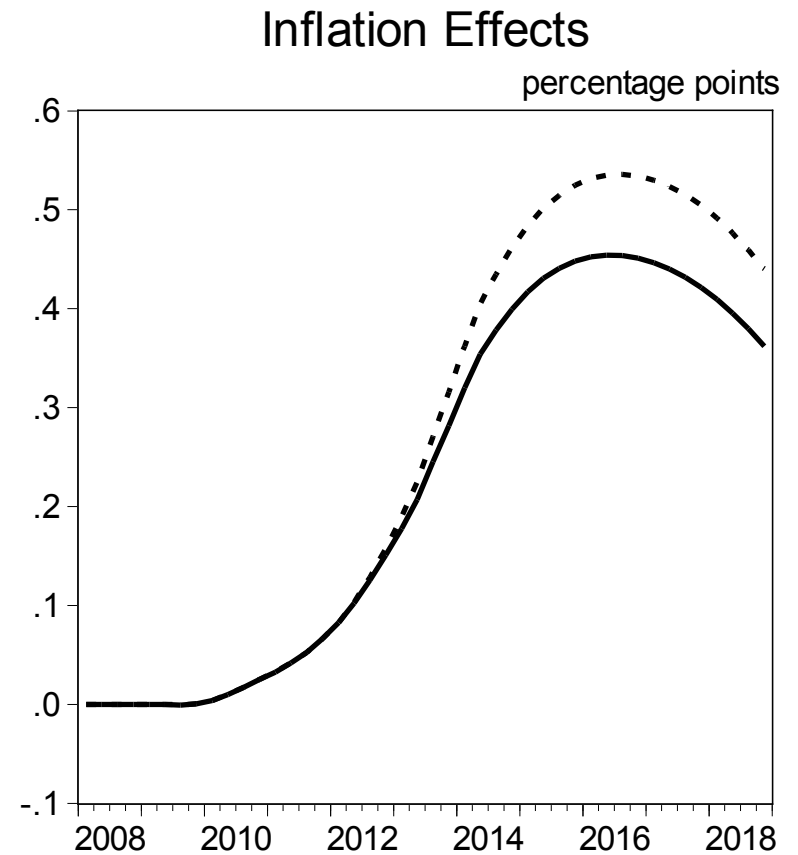

Source: Ihrig et al. (2012), Li and Wei (2013), and authors' calculations

# Simulation Procedure

1. Create set of overlapping baselines consistent with BC surveys
  - Solve for past/future shocks to policy and economy consistent with Mar 2009 real-time data, Blue Chip forecasts, estimated  $\beta$ , and expected QE term premium effects
  - Repeat parsing exercise for October 2009, March 2010, ... , October 2013
  - Simulating this sequence of past/expected shocks replicates evolution of the economy from early 2009 to late 2013
2. Re-simulate model eliminating shifts in  $\beta$  and QE-related reductions in term premiums
3. Difference between history and counterfactual simulation measures effective stimulus

# Baseline Estimates of Macro Effects

— non-inertial rule - - - inertial rule

# Alternative Estimates of Macro Effects

## Unemployment Effects

## Inflation Effects

- baseline model
- alternative inflation dynamics
- policy-linked house price effects
- rational expectations in financial markets only
- low interest elasticity of demand
